

Enzo Markarian

Boston, MA · enzomarkarian28@gmail.com · github.com/zeno-blade-creator · zeno-blade-creator.github.io

Computer Science and Game Development student at Northeastern. As a TA for 45 students at an MIT summer program, I created a research-based mind-mapping activity for before and after each lecture, and built the tools that ran it.

TEACHING & LEADERSHIP

MIT Beaver Works Summer Institute, Teaching Assistant, Serious Games with AI (*45 students, 9 instructors*) Jun – Aug 2026

- Came up with and led a mind-mapping activity based on learning research (retrieval practice, concept maps, metacognition), shaped by feedback from 2 TAs, which replaced an earlier post-lecture quiz idea. Student groups map 5 key words before each lecture, then add 5 more after, so the map shows what changed.
- Designed a Claude skill that reads lecture slides and suggests those words, choosing ones that spark curiosity before the lecture and connect ideas after it. Kept a daily log of what broke in each session and fed it back into the activity.
- Had Claude Code build *Mind-Mapper*, a mobile web app TAs used in class to record each group's participation across 12 lectures. [Claude Code](#)
- Proposed and led, with another TA, moving the course off MIT's internal GitHub into one public organization with a student site and a login-protected instructor hub that instructors used daily. Instructors approved it on July 24. [Claude Code](#)
- After the program, interviewed 5 students and wrote a learning-design proposal for next year, including how to help stuck students reason forward without AI doing the thinking. The mind-map format is being kept for 2027.

MIT Beaver Works Summer Institute, Student Team Lead, Serious Games with AI Jul 2025

- Led 3 teammates making a zombie-apocalypse camp game that measures how much players trust unreliable AI helpers across tasks of different stakes. Playtested with 6 players and presented the findings. Won the *AI Skill and Judgment* award.

Brown Pre-College, Team Lead, Systems Thinking & Game Design Summer 2024

- Led a team of 4, in a cohort of about 20, to build a game teaching opportunity cost: why companies underinvest in the environment when the benefit is shared and the cost is theirs. 20 people played it.

Los Altos High School Badminton, Spirit Lead 2023 – 2026

- Ran the team's family night for 130+ people and trivia and Jeopardy socials through the season; led the cheer squad and the team-bonding group.

PROJECTS

[Claude Code](#) = Claude wrote the code; I chose the goal, the order, and how to check it. [coded by me](#) = I wrote the code.

My Claude Code workflow (*write-up on my site*) [Claude Code](#) Aug 2026 – now

- Designed a pipeline that takes an idea to finished code: Claude questions my plan, writes a spec, and splits the work into tasks, marking which must run in order and which can run in parallel. A separate AI reviewer checks each one.
- Built two skills of my own on top of community ones: *ship* runs the pipeline with one human check, and *sharpen* turns mistakes into fixes. A rule only stays if a with/without test shows it matters; the first audit deleted 4 of the 6 it had just written.

Mac version of a video game practice tool (*C#, open source*) [Claude Code](#) Aug 2026

- Contributed a 21-file macOS port, riskiest part first; the maintainer is reviewing it over several rounds and offered to change his server to support it. He also replaced my crash-fix pull request with his own fix for the same bug.
- Caught an AI reviewer rejecting working code over a function it wrongly said didn't exist, and got it wrong myself when I claimed the project's API had no macOS option. It did. Now I check claims against the source.

Running a Unity 6 game on Mac with free, open-source Wine (*Whisky, CrossOver*) [Claude Code](#) Aug 2026

- Paid CrossOver ran the game, but free Whisky and Wine couldn't: no Unity 6 mouse clicks and broken screen sizing. When Claude said right-click already worked, I knew from playing that it didn't, and pushing back exposed an incomplete analysis. All buttons now work on the free version. Documented 6 bugs (2 in Whisky itself) and released the working setup as an open-source project (LGPL) so other Mac players can use it.

Top-down 2D stealth game (*C++, no game engine*) [coded by me](#) May – Aug 2025

- Wrote and understood the code myself with early AI autocomplete, learning CMake, compilers and game loops. Team lead with 2 teammates (92 of 107 commits); organized 10 playtesters. Also: [Blockaform](#), a Unity puzzle game built with Claude Code.

EDUCATION, SKILLS & HONORS

Northeastern University, B.S. Computer Science and Game Development, Sep 2026 – May 2030 (expected) · **Foothill College Middle College** (college classes in 11th–12th grade, 2024–2026): C++ (CS 2A, 2B), Calculus (1A, 1B, 1C), Discrete Math, Physics with Calculus (4A, 4B), Macro and Microeconomics · Los Altos HS, GPA 4.50 / 3.97

Written myself: C++, Python, C#, Unity, Git/GitHub, some Java · **With Claude Code:** Supabase, Cloudflare Pages & Access, Netlify, GitHub Actions, REST APIs, MCP servers, Claude skills

Curious about: using AI to help students learn more deeply; human + AI workflows that make both more productive

Honors: 2nd-round finalist, Google case competition · National Hispanic Recognition Program
